

2018 WeDo Lesson 3 Orchard School

The plan was for students to learn about spur gears, which are devices with triangular teeth that look like spurs on cowboy and cowgirl boots. The kids learn to mount these gears to axles in order to transfer mechanical energy from the motor to the wheels.

The students also learned that a partner school is about to get started so they recorded a greeting to those kids as part of the video for their work today. The video is about 10 minutes long and focuses mostly on the testing of the roers, in the library. Their excitement is palpable!
